EDUCATION

Wesleyan University | Middletown, CT **Expected Graduation: May 2027**

B.A. in Computer Science, German | GPA: 3.74/4.0

- **Relevant Coursework:** Software Engineering, Automata Theory, Discrete Mathematics, Logic & Functional Programming, Computational Media (Game Development), Data Structures, Information Security and Privacy
- **Honors:** Dean's List, Scholar-Athlete Honors Award
- **Activities:** Varsity Indoor and Outdoor Track and Field Captain

TECHNICAL SKILLS

Languages: Python, C++, C, Go, JavaScript/TypeScript, SQL, SMLNJ, GDScript
Frameworks & Tools: React, Go (chi), Django, Node.js, PostgreSQL, Docker, Git, GitHub Actions, MongoDB, Vite, Railway, Vercel, Figma, LiteLLM, BeautifulSoup, JIRA

RELEVANT EXPERIENCE

turingpoint GmbH | Hamburg, Germany **September 2025 - December 2025**

Software Engineer Intern

- Built a Python CVE classification app (LiteLLM → Anthropic) that non-engineers used to triage findings instead of reading advisories by hand.
- Pulled advisory text via Brave Search + BeautifulSoup so reviewers started from evidence, not a CVSS number.
- Designed Figma flows with PMs so the tool shipped to non-technical reviewers.

RESEARCH

Bioinformatics Research | Wesleyan University - Prof. Cohan, Prof Krizanc **February 2026 - Present**

Research Assistant

- Wrote a Python pipeline (Bakta → Roary → VeryFastTree → EcoSim) that replaced a manual gene presence/absence workflow.
- Separated species-level genomes from sequencing data with Pandas; plotted trees in Matplotlib for the lab.

Additive Manufacturing Research | Wesleyan University - Prof. Chang-Davidson **June 2026 - Present**

Research Assistant

- Developed a model using graph theory to simulate heat dispersion in a DED metal print.
- Simulated and printed different geometries to test accuracy and calibrate the software.

PROJECTS

SolverRL | C++17, pybind11, Python, SWI-Prolog, Stable-Baselines3, CMake, GoogleTest

- Reproduced a 2026 paper: distill a PPO policy into a Prolog decision list, then only accept program edits that raise exact discounted return on a finite KeyDoor MDP.
- C++17 core (FOIL-style induction, Bellman solve, EXPAND loop) with pybind11, GoogleTest/pytest CI, and a one-command pipeline from checkpoint to metrics.

Remindr | C++17, Go, React, PostgreSQL, Docker, GitHub Actions

- Shipped an offline-first reminder daemon in C++17 (Unix-socket IPC, libcurl sync, last-write-wins + tombstones) with a Go/Postgres API and React dashboard at remindr.gfedolfi.dev.
- Added JWT auth, Docker deploy on Railway, and GitHub Actions for Go tests, web build, and C++ on Linux + macOS.

TermiTama | C++17, CMake, FTXUI, JSON

- Built a terminal virtual pet game in C++17 using FTXUI with an FSM-driven lifecycle (Baby → Adult), four stat systems with offline time-delta decay capped at 12 hours, and a genetics engine with heritable stat caps and ±10% random mutation across breeding generations.
- Implemented a persistent save system using JSON serialization that auto-saves after every action, restores full game state on launch, and supports a Pet Box of up to 6 simultaneously active pets with free switching and adoption.

CVE Triage Agent | Python, Anthropic API

- Built a Python agent that looks up dependency CVEs, checks whether the vulnerable code path is actually reachable, and writes a severity report with evidence.
